Wordplaypen Issue #162
Design Documentation

Designers: Bright Hoang, Amy Lu, Edward Newell, Nicole Zhang
Developer: Simon Kurgan

Overview

Current state:
The current state of the font face chooser (it's just called "face" on the website) is just a list of fonts.
What it currently lacks:
- Appearance (what it looks like)
- Styles/type (typography specifics: sans, serifs, etc.),
- Language accessibility info (whether or not the font face is usable with other languages).
- Weight and italics support

What it looks like *currently:*

<u>Desired state:</u>

As specified in the GitHub issues page, we want:

- An information-rich interface for fonts that isn't too overwhelming
  - Visually distinct fonts
  - Weight and italic availability
  - Language availability (might have to be a filler feature because localization is limited to just Spanish & Mandarin right now)
  - General accessibility metadata (Currently lacking research)
  - Perhaps a filter of typefaces to match the user's intention (for headers vs captions vs body text)
  - "Advance filters" option to be abstract
- Features of weights and italics (it's currently not available on the software but exists in the repo; wordplay -> static -> fonts -> *certain fonts*)

All while still maintaining proper aesthetics and themes with the current theme.

Formal Proposal
